### Project description:

Our task within this project was to process complete manufacturing documentation of four dimensional series of Filtration Equipment. The customer handed us their configuration drawings of particular modules of the largest dimensional set. Our team worked on all variations in 3D in the SolidEDGE software and, after the customer's approval, we prepared associative 2D manufacturing documentation. Within the framework of our solution, the documentation included "Value analysis" observations in order to minimize the overall manufacturing costs. Elaboration of our solution in the company's PDM system Elaine PDM with the possibility of bulk data transmission into the customer's PDM system was a great benefit for the customer.
